

#### Number/code: OM/E19

#### Title: LOW ENVIRONMENTAL IMPACT FOOD (E.G. VEGETARIAN)

#### **Guidelines section:**

#### Description:

All stadiums distributed meals before and during the football matches. Several sport and football organisations have adopted food choice to reduce the environmental impact of this activity.

For example, the Forest Green Rovers, is an English football club known for being the first vegan team in the world. The choice is to raise awareness among supporters and players towards a more sustainable lifestyle. In fact, being vegan for the team means not only to avoid any kind of organic food or derivate but also to contribute to the reduction of the negative impact towards the environmental and animal welfare during the livestock farming. In fact a study of University of Oxford reveals that meat and dairy production is responsible for 60% of agriculture's greenhouse gas emissions, while the products themselves providing just 18% of calories and 37% of protein levels around the world.

Additional options suggested by the International Olympic Committee (IOC) are:

- Food sourcing to include at least 50 per cent local products;
- Food waste to be reduced by 40 per cent per meal between 2017 and 2020;

• Finished product packaging and disposable tableware to be reduced by 20 per cent per meal between 2017 and 2020;

- Vegetarian offer to be increased by 2020;
- Use of compostable tableware;

• Offer seasonal menus in order to **reduce road miles and the energy needed** for fresh produce production;

• Use food from organic farms.

Examples:

For food procurement, organizers of Tokyo 2020 will seek to reduce CO2 emissions associated with logistics by selecting seasonal food produced in neighbouring regions wherever possible, with consideration given to quality and costs.

At the Frankfurt City Marathon in 2005 a great effort was made to promote organic food. Ten companies from the health foods sector provided the complete catering for runners along the course and at the finishing line. In order to help spectators to appreciate the campaign, 130 "organic runners" participated in the race. In addition, an "Organic Mile" was created for the marathon with entertainment, information, catering and a relaxation zone. Because of its great success it is planned to make the "Organic Race" a regular feature of the Frankfurt City Marathon.

4) Roland Garros: in partnership with Yann Arthus-Bertrand's Goodplanet Foundation, the FFT works with all of the tournament's food suppliers and caterers on a three-year sustainable food plan. The aim is to provide the tournament's audiences with more sustainable produce that is organic, seasonal, and from short distribution channels.

5) At the London 2012 Games a Food Vision promoted organic, fair-trade, local, MSC or Red Tractor food. Free drinking water distribution (i.e. without glasses) was ensured in the nearby of stadia. Caterers were regularly assessed also in terms of pricing benchmarking.

# Environmental benefits:

Adopting a vegan diet could be the "single biggest way" to reduce your environmental impact on earth. Researchers at the University of Oxford found that cutting meat and dairy products from your diet could reduce an individual's carbon footprint from food by up to 73 per cent. Meanwhile, if everyone stopped eating these foods, they found that global farmland use could be reduced by 75 per cent, an area equivalent to the size of the US, China, Australia and the EU combined. Not only would this result in a significant drop in greenhouse gas emissions, it would also free up wild land lost to agriculture, one of the primary causes for mass wildlife extinction. The study, published in the journal *Science*, is one of the most comprehensive analyses to date into the detrimental effects farming can have on the environment and included data on nearly 40,000 farms in 119 countries.

The findings reveal that meat and dairy production is responsible for 60 per cent of agriculture's greenhouse gas emissions, while the products themselves providing just 18 per cent of calories and 37 per cent of protein levels around the world.

Similarly, organic farming avoids the use of industrial fertilizers and pesticides. This means soil and groundwater remain unharmed by chemicals. Because organic farming uses mineral fertilizers from natural manure, energy which would otherwise be used in the production of industrial fertilizer is saved.

# Economic benefits:

Organic food is generally more expensive.

# Applicability and replicability potential

The measure could be replicated in every stadium.
